

INTRODUCTION

This Annual Drinking Water Quality Report is presented by the Halifax County Service Authority (HCSA) for calendar year 2023 and is designed to inform you about your drinking water quality. Our goal at HCSA is to provide you with a safe and dependable supply of drinking water, and we want you to understand the efforts we make to protect your water supply. The quality of your drinking water must meet state and federal requirements administered by the Virginia Department of Health (VDH). More information can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791) or visiting www.epa.gov/safewater.

If you have questions about this report, or if you want additional information about any aspect of your drinking water or want to know how to participate in decisions that may affect the quality of your drinking water, please contact: William Samples, HCSA Superintendent of Water at 434-575-4255

GENERAL INFORMATION

The sources of drinking water [both tap water and bottled water] include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- *Inorganic contaminants*, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- *Pesticides and herbicides*, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- *Organic chemical contaminants*, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- *Radioactive contaminants*, which can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the Environmental Protection Agency (EPA) prescribes regulations which limit the concentration of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health. All drinking water, including bottled drinking water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information can be obtained by calling the EPA Safe Drinking Water Hotline (800-426-4791).

VULNERABLE POPULATIONS

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by

Cryptosporidium and other microbiological contaminants are available from the EPA Safe Drinking Water Hotline (800-426-4791).

WATER CONSERVATION TIPS

Did you know that the average U.S. household uses approximately 350 gallons of water per day? Luckily, there are many low-cost or no-cost ways to conserve water. Water your lawn at the least sunny times of the day. Fix toilet and faucet leaks. Take short showers - a 5-minute shower uses 4 to 5 gallons of water compared to up to 50 gallons for a bath. Turn the faucet off while brushing your teeth and shaving; 3-5 gallons go down the drain per minute. Teach your kids about water conservation to ensure a future generation that uses water wisely. Make it a family effort to reduce next month's water bill!

ADDITIONAL INFORMATION FOR LEAD

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Halifax County Service Authority is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at www.epa.gov/safewater/lead.

SOURCE(S) AND TREATMENT OF YOUR DRINKING WATER

The source of your drinking water is groundwater drawn from two drilled wells. The groundwater is treated with a sodium hypochlorite solution for continuous disinfection and is treated with a sodium bicarbonate solution for pH adjustment and corrosion control.

A source water assessment of our system was conducted in 2002 by the Virginia Department of Health. The wells were determined to be of high susceptibility to contamination using the criteria developed by the state in its approved Source Water Assessment Program. The assessment report consists of maps showing the source water assessment area, an inventory of known land use activities of concern, and documentation of any known contamination within the last 5 years. The report is available by contacting your water system representative, Mr. William Samples, HCSA Superintendent of Water at (434) 575-4255.

DEFINITIONS

In the table on the next page and elsewhere in this report you will find many terms and abbreviations you might not be familiar with. The following definitions are provided to help you better understand these terms:

Non-detects (ND) - lab analysis indicates that the contaminant is not detectable, based on the limits of the analytical equipment used.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or one penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter ($\mu\text{g/l}$) - one part per billion corresponds to one minute in 2,000 years, or one penny in \$10,000,000.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

Action Level (AL) - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level Goal (MCLG) - the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Contaminant Level (MCL) - the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Residual Disinfectant Level Goal (MRDLG) – the level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Maximum Residual Disinfectant Level (MRDL) – the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Running Annual Average (RAA) – the average level of a contaminant in drinking water for a period of one year, calculated each calendar quarter by including the contaminant level averages for the three previous calendar quarters.

The U.S. Environmental Protection Agency sets MCLs at very stringent levels. In developing the standards EPA assumes that the average adult drinks 2 liters of water each day throughout a 70-year life span. EPA generally sets MCLs at levels that will result in no adverse health effects for some contaminants or a one-in-ten-thousand to one-in-one-million chance of having the described health effect for other contaminants.

WATER QUALITY RESULTS

We routinely monitor for various contaminants in the water supply to meet all regulatory requirements. The table below lists only those contaminants that had some level of detection in the last five years. Many other contaminants have been analyzed but were not present or were below the detection limits of the lab equipment. The state allows us to monitor some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our results, though representative, are more than one year old.

Inorganic Contaminants						
Contaminant (Unit of Measurement)	MCLG	MCL	Level Found/Range	Violation	Date of Sample	Typical Source of Contamination
Nitrate (ppm)	10	10	Highest: 4.60 Range: 1.28 – 4.60	No	Sept 2023	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
Chromium (ppb)	10	10	Highest: <0.01	No	July 2022	Discharge from steel and pulp mills; erosion of natural deposits
Fluoride (ppm)	4	4	Highest: 0.24 Range: ND – 0.24	No	July 2022	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Barium (ppm)	2	2	Highest: 0.035 Range: 0.016 - 0.035	No	July 2022	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Radiological Contaminants						
Contaminant (Unit of Measurement)	MCLG	MCL	Level Found/Range	Violation	Date of Sample	Typical Source of Contamination
Alpha emitters (pCi/L)	0	15	Highest: 1.8 Range: 1.4 - 1.8	No	April 2023	Erosion of natural deposits
Lead and Copper						
Contaminant (Unit of Measurement)	MCLG	MCL	Level Found/Range	Exceedence	Date of Sample	Typical Source of Contamination

Lead (ppb)	0	AL=15	1.4 (90 th percentile) Range: <2-2.76 Of the five samples collected, none exceeded the AL.	No	September 2022	Corrosion of household plumbing systems; Erosion of natural deposits
Copper (ppm)	1.3	AL=1.3	.331 (90 th percentile) Range: <0.02 – 0.432 Of the five samples none exceeded the AL.	No	September 2022	Corrosion of household plumbing systems; Erosion of natural deposits
Disinfection Byproducts and Residuals						
Contaminant (Unit of Measurement)	MCLG	MCL	Level Found/Range	Violation	Date of Sample	Typical Source of Contamination
TTHMs Total Trihalomethanes (ppb)	N/A	80	Results: 4.6	No	September 2022	By-product of drinking water disinfection
HAA5s (Total Haloacetic Acids) ppb	N/A	60	Results: ND	No	September 2022	By-product of drinking water disinfection
Chlorine (ppm)	MRDLG = 4	MRDL = 4	Highest RAA: 0.70 Range: 0.40 – 1.2	No	Monthly 2023	Water additive used to control microbes

Unregulated Contaminants

There is no state or federal MCL for sodium. Monitoring is required to provide information to consumers and health officials that are concerned about sodium intake due to dietary precautions. The sodium levels in your water were 50.2 ppm to 59.7 ppm as tested in July 2022. People on a sodium-restricted diet should consult a physician about the level of sodium in the water they drink.

VIOLATION INFORMATION

The Community of Clover did not receive any violations for the 2023 calendar year. We are pleased to report to you that there were no detections of total coliforms or fecal coliforms in the monthly samples collected during calendar year 2023.

This Drinking Water Quality Report was prepared by William Samples, HCSA Superintendent of Water, Halifax County Service Authority, at 2529 Houghton Avenue, South Boston, VA 24592. Should you have questions about this report, or if you want additional information about any aspect of your drinking water or want to know how to participate in decisions that may affect the quality of your drinking water, please contact Mr. William Samples, HCSA Superintendent of Water at (434) 575-4255.
